Soluble Proteins

The BCS Screen HT-96 MD1–105

A 96 condition protein crystallization screen incorporating PEG smears[1] for broader chemical space coverage.

MD1-105 is presented as 96 x 1 mL conditions.

Features of The BCS Screen:

- Contains defined PEG Smears – efficient screening of chemical space.
- Wide PEG coverage.
- Screen against multiple additives. Contains multiple salts/additives shown to promote crystallization.
- Proven crystallization successes with multiple proteins.

Introduction

The Basic **C**hemical **S**pace (**BCS) Screen** developed at the Structural Genomics Consortium (SGC), Oxford, UK, has been formulated to include PEG smears - enabling a broader search of chemical space than just using individual PEGS.

The benefit of using PEG smears is that it reduces the number of PEG variables while maintaining a large coverage of PEG space. The PEGs in **The BCS Screen** are grouped by molecular weight and mixed to create four PEG smears (available to purchase separately). The smears cover a broader range of chemical space while reducing the number of PEG variables.

The BCS Screen was tested for crystallization potency using a set of 191 proteins from projects at the Structural Genomics Consortium (SGC) based in Oxford, UK. The success rates of the smear-based screen were similar to the combined success rates of the other four in-house screens exploited regularly at the SGC. In particular, the ability of the smear-based screen promoted crystal growth of several proteins that had been difficult to crystallize (Figure 1) using the commercial sets.

The BCS Screen: The first 24 conditions in The BCS Screen form a grid screen of the four PEG Smears against pH (range 4.5-9.5). The remaining 72 conditions consist of a sparse matrix screen in which the precipitant is always one of the PEG smears but with a variety of additives and buffers. The additives include some of the more unusual crystal-promoting agents such as Rubidium chloride (also useful for phasing) and ammonium nitrate. More common additives including Sodium Bromide (useful for phasing) and glycerol are also used in the screen. In addition, multiple salts/additives are implemented, which have been shown also to promote crystallization.

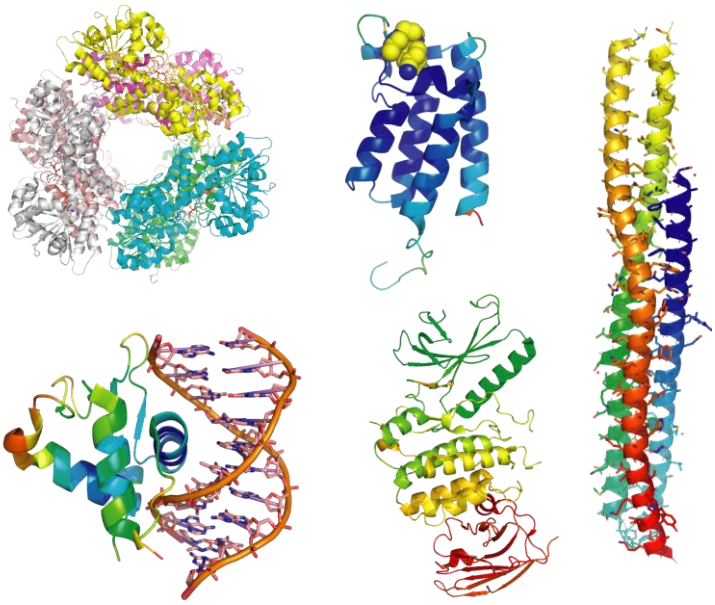

*Figure 1. Examples of crystal structures obtained from using **The BCS Screen** at the SGC. For example, single-domain proteins, protein-protein complex and protein-DNA complex.*

The BCS Screen is formulated in collaboration with, Apirat Chaikuad, Elizabeth MacLean, Stefan Knapp and Frank von Delft at the Structural Genomics Consortium, Oxford, UK.

[1] PEG smears, originally suggested by Janet Newman (ActaD 2005)

PEG Smear compositions used in The BCS Screen

Eleven PEGs were selected from those commonly used in most commercial screens (Figure 2) to provide molecular weight (MW) coverage from 400 to 10k Da, namely PEG 400, 550 MME, 600, 1K, 2K, 3350, 4K, 5KMME, 6K, 8K and 10K.
These eleven PEGs were then divided into three classes based on molecular weight, low (≤1k Da), medium (>1k-5k Da), and high (≥6k Da).

The four smears in The BCS Screen consist of:

PEG Smear	Composition	Catalogue Number (100 mL)	Catalogue Number (250 mL)
50% v/v PEG Smear Low	12.5%v/v PEG 400 12.5%v/v PEG 500 MME 12.5%v/v PEG 600 12.5%w/v PEG 1000	MD2-100-258	MD2-250-258
50% v/v PEG Smear Medium	12.5%w/v PEG 3350 12.5%w/v PEG 4000 12.5%w/v PEG 2000 12.5%w/v PEG 5000 MME	MD2-100-259	MD2-250-259
50% v/v PEG Smear High	16.67%w/v PEG 8000 16.67%w/v PEG 10000 16.67%w/v PEG 6000	MD2-100-260	MD2-250-260
50% v/v PEG Smear Broad*	4.55%v/v PEG 400 4.55%v/v PEG 500 MME 4.55%v/v PEG 600 4.55%w/v PEG 1000 4.55%w/v PEG 2000 4.55%w/v PEG 3350 4.55%w/v PEG 4000 4.55%w/v PEG 5000 MME 4.55%w/v PEG 6000 4.55%w/v PEG 8000 4.55%w/v PEG 10000	MD2-100-261	MD2-250-261

***** The Broad Smear is similar to the originally described smear (Newman et al., 2005), which did not however contain any methylated polymers.

Soluble Proteins

Formulation Notes:

The BCS Screen reagents are formulated using ultrapure water (>18.0 MΩ) and are sterile-filtered using 0.22 µm filters. No preservatives are added.

Final pH may vary from that specified on the datasheet. Molecular Dimensions will be happy to discuss the precise formulation of individual reagents.
Individual reagents and stock solutions for optimization are available from Molecular Dimensions.

Enquiries regarding **The BCS Screen** formulation, interpretation of results or optimization strategies are welcome. Please e-mail, fax or phone your query to Molecular Dimensions.

Contact and product details can be found at www.moleculardimensions.com

Hints & Tips

The BCS Screen conditions are not cryoprotected, so cryoprotection will have to be carried out. For this we recommend CryoProtX (MD1-61).

To optimize PEG Smears we recommend the following: treat the PEG smears as 'normal PEG' and just vary the concentration, or deconvolute the effects of the individual PEGs as described in Chaikuad *et al* (2015).

The screen has been predominantly tested with soluble proteins, but this does not mean it cannot work for membrane proteins.
